ABSTRACT OF THE DISCLOSURE

An absorptive product can form and hold a stereoscopic shape which is properly formed to be snugly fitted on a complicated three-dimensional shape of a user's body to prevent leaking of an evacuated body fluid or the like to the outside of the body. The absorptive product can include a back sheet which has a shape elongated in one direction and that can prevent the permeation of liquid, a liquid permeable surface material which is arranged on a surface side which is brought into contact with a body, and an absorbent which is arranged between the back sheet and the surface material and absorbs and holds the liquid which permeates the surface material. The absorptive product can further include a resilient body which is fixed at least to the absorbent side in a center region in the lateral direction T of the product to impart a contracting force with respect to the arrangement direction. Slits can be formed in the absorbent in the vicinity of a region on which the contracting operation of the resilient body acts.
